ICD-10 Radiology Update

On October 1, 2015, the ICD-9-CM code set that is used to report medical diagnoses in the United States will be replaced with the ICD-10-CM code set. The new code set provides more than 68,000 codes, compared to 13,000 in ICD-9, and introduces alphanumeric category classifications for the first time. As such, ICD-10 is much more proficient at describing current conditions and healthcare practices, and possesses the flexibility to expand as needed to accommodate the changing environment.

This newsletter is part of a series by APS Medical Billing that illustrates the changes that will occur in transitioning to the new code set for sample conditions, providing the additional documentation that should be included in the radiologist's report to direct proper diagnosis code assignment, come October 1, 2015.

In this edition we will take a look at Cholelithiasis diagnoses and illustrate the increased specificity under the ICD-10-CM nomenclature.

Cholelithiasis

In ICD-9-CM there are 20 codes available, while ICD-10-CM doubles the code choices, requiring dictation to specify: **Location, additional condition, nature of additional condition, presence of obstruction**

- Gallbladder
 - With acute cholecystitis
 - With or without obstruction
 - With other cholecystitis
 - Chronic
 - Acute and chronic
 - Other
 - With or without obstruction
 - Without cholecystitis
 - With or without obstruction

People. Trust. Results.
